Outline

1 **Backshift notation reviewed**

2 Seasonal ARIMA models

3 ARIMA vs ETS

4 Lab session 12

Backshift notation

A very useful notational device is the backward shift operator, B, which is used as follows:

$$By_t = y_{t-1} \ .$$

Backshift notation

A very useful notational device is the backward shift operator, B, which is used as follows:

$$By_t = y_{t-1} \, .$$

In other words, B, operating on y_t, has the effect of **shifting the data back one period**.

Backshift notation

A very useful notational device is the backward shift operator, B, which is used as follows:

$$By_t = y_{t-1} \, .$$

In other words, B, operating on y_t, has the effect of **shifting the data back one period**. Two applications of B to y_t **shifts the data back two periods**:

$$B(By_t) = B^2 y_t = y_{t-2} \, .$$

Backshift notation

A very useful notational device is the backward shift operator, B, which is used as follows:

$$By_t = y_{t-1} .$$

In other words, B, operating on y_t, has the effect of **shifting the data back one period**. Two applications of B to y_t **shifts the data back two periods**:

$$B(By_t) = B^2 y_t = y_{t-2} .$$

For monthly data, if we wish to shift attention to "the same month last year," then B^{12} is used, and the notation is $B^{12} y_t = y_{t-12}$.

Backshift notation

- First difference: $1 - B$.
- Double difference: $(1 - B)^2$.
- dth-order difference: $(1 - B)^d y_t$.
- Seasonal difference: $1 - B^m$.
- Seasonal difference followed by a first difference: $(1 - B)(1 - B^m)$.
- Multiply terms together together to see the combined effect:

$$(1 - B)(1 - B^m)y_t = (1 - B - B^m + B^{m+1})y_t$$
$$= y_t - y_{t-1} - y_{t-m} + y_{t-m-1}.$$

Backshift notation for ARIMA

- ARMA model:

$$y_t = c + \phi_1 y_{t-1} + \cdots + \phi_p y_{t-p} + e_t + \theta_1 e_{t-1} + \cdots + \theta_q e_{t-q}$$

$$= c + \phi_1 B y_t + \cdots + \phi_p B^p y_t + e_t + \theta_1 B e_t + \cdots + \theta_q B^q e_t$$

$$\phi(B) y_t = c + \theta(B) e_t$$

where $\phi(B) = 1 - \phi_1 B - \cdots - \phi_p B^p$

and $\theta(B) = 1 + \theta_1 B + \cdots + \theta_q B^q$.

Backshift notation for ARIMA

- ARMA model:

$$y_t = c + \phi_1 y_{t-1} + \cdots + \phi_p y_{t-p} + e_t + \theta_1 e_{t-1} + \cdots + \theta_q e_{t-q}$$

$$= c + \phi_1 B y_t + \cdots + \phi_p B^p y_t + e_t + \theta_1 B e_t + \cdots + \theta_q B^q e_t$$

$$\phi(B) y_t = c + \theta(B) e_t$$

$$\text{where } \phi(B) = 1 - \phi_1 B - \cdots - \phi_p B^p$$

$$\text{and } \theta(B) = 1 + \theta_1 B + \cdots + \theta_q B^q.$$

- ARIMA(1,1,1) model:

$$(1 - \phi_1 B) \quad (1 - B) y_t \;=\; c + (1 + \theta_1 B) e_t$$

$$\qquad \uparrow \qquad\qquad \uparrow \qquad\qquad\quad \uparrow$$

$$\text{AR(1)} \qquad \text{First} \qquad\quad \text{MA(1)}$$

Backshift notation for ARIMA

■ ARIMA(p, d, q) model:

$$(1 - \phi_1 B - \cdots - \phi_p B^p) \ (1 - B)^d y_t \ = \ c + (1 + \theta_1 B + \cdots + \theta_q B^q)e_t$$

$$\underset{\text{AR}(p)}{\uparrow} \qquad \underset{d \text{ differences}}{\uparrow} \qquad \underset{\text{MA}(q)}{\uparrow}$$

Outline

Seasonal ARIMA models

ARIMA	(p, d, q)	$(P, D, Q)_m$
	↑	↑
	Non-seasonal part of the model	Seasonal part of of the model

where m = number of observations per year.

Seasonal ARIMA models

E.g., ARIMA$(1, 1, 1)(1, 1, 1)_4$ model (without constant)

Seasonal ARIMA models

E.g., ARIMA$(1, 1, 1)(1, 1, 1)_4$ model (without constant)

$$(1-\phi_1 B)(1-\Phi_1 B^4)(1-B)(1-B^4)y_t = (1+\theta_1 B)(1+\Theta_1 B^4)e_t.$$

Seasonal ARIMA models

E.g., ARIMA$(1, 1, 1)(1, 1, 1)_4$ model (without constant)

$$(1-\phi_1 B)(1-\Phi_1 B^4)(1-B)(1-B^4)y_t = (1+\theta_1 B)(1+\Theta_1 B^4)e_t.$$

$\begin{pmatrix} \text{Non-seasonal} \\ \text{AR(1)} \end{pmatrix}$ $\begin{pmatrix} \text{Seasonal} \\ \text{AR(1)} \end{pmatrix}$ $\begin{pmatrix} \text{Non-seasonal} \\ \text{difference} \end{pmatrix}$ $\begin{pmatrix} \text{Seasonal} \\ \text{difference} \end{pmatrix}$ $\begin{pmatrix} \text{Non-seasonal} \\ \text{MA(1)} \end{pmatrix}$ $\begin{pmatrix} \text{Seasonal} \\ \text{MA(1)} \end{pmatrix}$

Seasonal ARIMA models

E.g., ARIMA$(1, 1, 1)(1, 1, 1)_4$ model (without constant)
$(1-\phi_1 B)(1-\Phi_1 B^4)(1-B)(1-B^4)y_t = (1+\theta_1 B)(1+\Theta_1 B^4)e_t$.

All the factors can be multiplied out and the general model written as follows:

$$y_t = (1 + \phi_1)y_{t-1} - \phi_1 y_{t-2} + (1 + \Phi_1)y_{t-4}$$
$$- (1 + \phi_1 + \Phi_1 + \phi_1\Phi_1)y_{t-5} + (\phi_1 + \phi_1\Phi_1)y_{t-6}$$
$$- \Phi_1 y_{t-8} + (\Phi_1 + \phi_1\Phi_1)y_{t-9} - \phi_1\Phi_1 y_{t-10}$$
$$+ e_t + \theta_1 e_{t-1} + \Theta_1 e_{t-4} + \theta_1\Theta_1 e_{t-5}.$$

Common ARIMA models

In the US Census Bureau uses the following models most often:

ARIMA$(0,1,1)(0,1,1)_m$	with log transformation
ARIMA$(0,1,2)(0,1,1)_m$	with log transformation
ARIMA$(2,1,0)(0,1,1)_m$	with log transformation
ARIMA$(0,2,2)(0,1,1)_m$	with log transformation
ARIMA$(2,1,2)(0,1,1)_m$	with no transformation

Seasonal ARIMA models

The seasonal part of an AR or MA model will be seen in the seasonal lags of the PACF and ACF.

ARIMA$(0,0,0)(0,0,1)_{12}$ will show:

- a spike at lag 12 in the ACF but no other significant spikes.
- The PACF will show exponential decay in the seasonal lags; that is, at lags 12, 24, 36, ...

ARIMA$(0,0,0)(1,0,0)_{12}$ will show:

- exponential decay in the seasonal lags of the ACF
- a single significant spike at lag 12 in the PACF.

European quarterly retail trade

```
autoplot(euretail) +
  xlab("Year") + ylab("Retail index")
```
European quarterly retail trade

```
euretail %>% diff(lag=4) %>% ggtsdisplay()
```

European quarterly retail trade

```
euretail %>% diff(lag=4) %>% diff() %>%
  ggtsdisplay()
```
European quarterly retail trade

- $d = 1$ and $D = 1$ seems necessary.
- Significant spike at lag 1 in ACF suggests non-seasonal MA(1) component.
- Significant spike at lag 4 in ACF suggests seasonal MA(1) component.
- Initial candidate model: ARIMA$(0,1,1)(0,1,1)_4$.
- We could also have started with ARIMA$(1,1,0)(1,1,0)_4$.

European quarterly retail trade

```
fit <- Arima(euretail, order=c(0,1,1),
    seasonal=c(0,1,1))
checkresiduals(fit)
```

Residuals from ARIMA(0,1,1)(0,1,1)[4]

ARIMA(2,1,3)(0,1,1)[12]	0.0634
ARIMA(2,1,4)(0,1,1)[12]	0.0632

Cortecosteroid drug sales

- Models with lowest AICc values tend to give slightly better results than the other models.
- AICc comparisons must have the same orders of differencing. But RMSE test set comparisons can involve any models.
- No model passes all the residual tests.
- Use the best model available, even if it does not pass all tests.
- In this case, the ARIMA$(3,0,1)(0,1,2)_{12}$ has the lowest RMSE value and the best AICc value for models with fewer than 6 parameters.

Cortecosteroid drug sales

```
fit <- Arima(h02, order=c(3,0,1), seasonal=c(0,1,2),
  lambda=0)
autoplot(forecast(fit)) +
  ylab("H02 sales (million scripts)") + xlab("Year")
```

Forecasts from ARIMA(3,0,1)(0,1,2)[12]

Outline

ARIMA vs ETS

- Myth that ARIMA models are more general than exponential smoothing.

- Linear exponential smoothing models all special cases of ARIMA models.

- Non-linear exponential smoothing models have no equivalent ARIMA counterparts.

- Many ARIMA models have no exponential smoothing counterparts.

- ETS models all non-stationary. Models with seasonality or non-damped trend (or both) have

Equivalences

ETS model	ARIMA model	Parameters
ETS(A,N,N)	ARIMA(0,1,1)	$\theta_1 = \alpha - 1$
ETS(A,A,N)	ARIMA(0,2,2)	$\theta_1 = \alpha + \beta - 2$
		$\theta_2 = 1 - \alpha$
ETS(A,A,N)	ARIMA(1,1,2)	$\phi_1 = \phi$
		$\theta_1 = \alpha + \phi\beta - 1 - \phi$
		$\theta_2 = (1 - \alpha)\phi$
ETS(A,N,A)	ARIMA(0,0,m)(0,1,0)$_m$	
ETS(A,A,A)	ARIMA(0,1,$m + 1$)(0,1,0)$_m$	
ETS(A,A,A)	ARIMA(1,0,$m + 1$)(0,1,0)$_m$
